FINGER JOINTED MOULDINGS

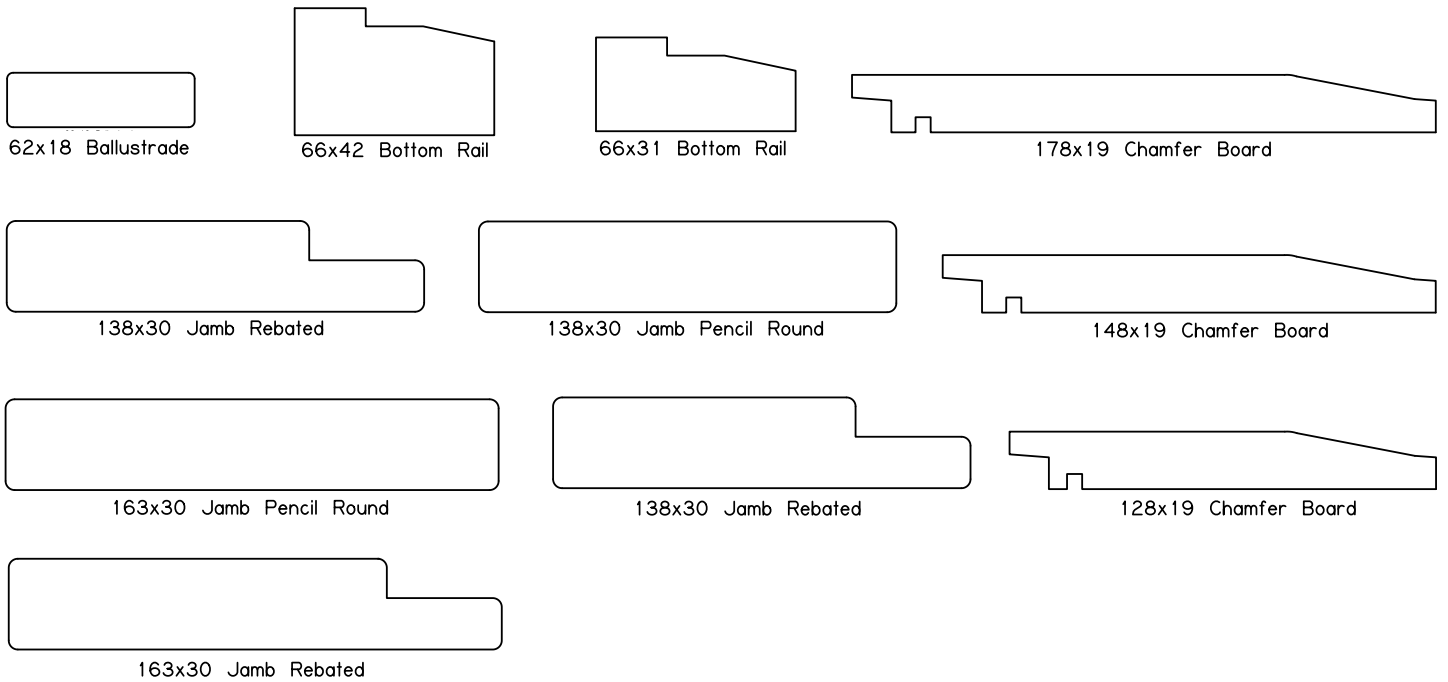

Subtle but seen, attention to detail

Mouldings are an essential element to any interior environment & should be given the same amount of consideration & discussion as your choice of colours or furniture.

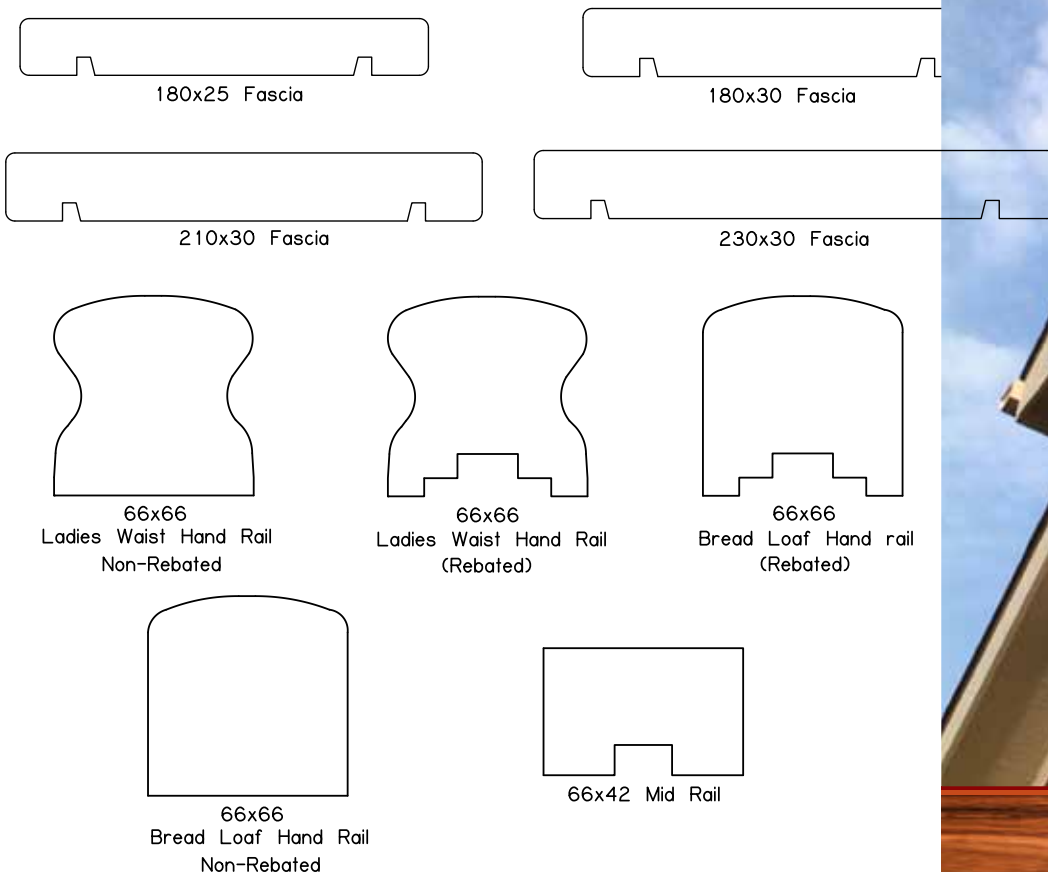

Mouldings create continuity with the past whilst echoing the simplicity & style of the post war era.

Good design depends on close attention to detail & quality finishing. Simmonds Lumber Select Mouldings provide the right product to give your required space the finishing touch it needs.

H3 Treated & Primed

Our Primed H3 Treated product range utilises the latest technology available in Glue formulations and Azole treatment chemicals to provide you with the assurance that the product is fit for purpose. Product sourced from Arauco comes with the added benefit of an oil based primer that is then sanded before a coating of acrylic primer is added to prepare the timber for the final top coats of your choice.

STORAGE AND HANDLING

Timber is a natural product, and it will react to changes in the environment during the life of the product. Every effort is made during manufacturing to minimise the effect these changes may have on the final appearance of the product, however raised grain, swelling and resin bleed are natural characteristics and may occur as a result of changes to climatic conditions. To minimise the opportunity for these changes to impact on the finished product we recommend the following steps be undertaken when storing, handling and installing these products.

- All products should be stored flat – at least 150mm off the ground and evenly supported in a well ventilated area. Protect the product from moisture (including ground moisture), humidity and weather at all times.
- Full length mouldings should not be picked up from one end only, always ensure that there is adequate support for the length of the board, to prevent the board from breaking under its own weight.
- For treated products, ensure that all surfaces that have been cut, drilled or rebated are re-treated with a suitable in-can timber preservative, following the manufacturers recommendations.
- Pre-Primed products have been coated with a premium quality primer designed to provide protection, and minimise the effects of checking, cracking, and cupping of the pine moulding, prior to the application of two coats of a premium quality top coat finish in accordance with the paint manufacturers recommendations.
- Pre-Primed products must be painted within 4 weeks of installation, and should remain covered on site until fixed in position.
